

Xray-Lynqa integration

Release faster with agentic AI inside Jira with Xray and Lynqa.

From requirement to automatic test execution, everything is connected, traceable, and human-validated. Xray and Lynqa help teams turn requirements into actionable test cases, automatically execute existing manual and Cucumber tests, apply tester-like reasoning throughout execution, and generate structured, step-by-step evidence ready for review.

No rewriting. No scripts. No recording. No maintenance.

Works inside the tools you already use. AI built for testing.

The Xray-Lynqa integration frees your QA team from the execution grind.

In most organizations, 60 to 80% of test cases remain manual, leaving teams with limited resources, peak load pressure, and inconsistent evidence. Together, Xray and Lynqa handle up to 80% of that execution effort without changing how your team writes or manages tests.

Your QA team stays in control. AI executes and delivers the evidence.

"Agentic AI handles the execution grind, while your team focuses on what matters. No code. No recording. No rework. Just automatic execution, evidence ready to review. One tool. One lifecycle. Inside Jira."

Xray completes your DevOps workflow, enabling teams to test smarter, release faster, and deliver high-quality software at scale.

Lynqa is Smartesting's AI test execution agent. It runs functional web tests from manual or Cucumber cases and delivers step-by-step evidence and screenshots.

The Benefits

Full AI-powered test lifecycle, in one place. From requirement to automatic test execution, inside Jira. No tool switching, no silos. AI assists at every stage, design, execution, all connected.

Zero code, zero maintenance, zero friction. No automation suite to build or sustain, no tests to rewrite, no complicated setup. Works with your existing manual or Gherkin tests as they are. Adapts to UI and data changes.

AI designed for testing, humans in control. Lynqa reasons like a tester at every step, checks expected results, and captures standardized step-by-step evidence screenshots and logs. Your team validates every result.

Scale test execution easily. Run tests in parallel, absorb peak load at release time, and free your team from repetitive execution.

Leverage reporting capabilities. Traceable, standardized execution evidence saved directly in Xray. Full visibility over requirement coverage thanks to traceability links maintained by the Xray -Lynqa integration, ready at any time.

About Xray

Xray completes your DevOps workflow, empowering teams to test and deliver the highest quality software at full speed. Seamlessly integrated into Jira, Xray supports the full testing lifecycle — from planning and execution to reporting — while offering AI-powered test design, automation integration, and scalable workflows. By combining visibility, reliability, and efficiency, Xray ensures teams can release software confidently and at the pace of modern DevOps, turning testing into a strategic advantage.
